10:40: Multispectral optoacoustic tomography: a paradigm shift in biomedical research and clinical diagnostics

Daniel Razansky

Univ. of Zurich (Switzerland) and ETH Zurich (Switzerland)

Abstract: Optoacoustic imaging is transforming biological discovery by offering non-invasive observations of the versatile endogenous and exogenous optical absorption contrast combined with excellent spatial and temporal resolution and centimeter scale penetration into living tissues. Our state-of-the-art implementations of multi-spectral optoacoustic tomography (MSOT) are based on multi-wavelength excitation of tissues to visualize specific molecules within opaque living tissues, thus simultaneously delivering structural, functional, metabolic, and molecular information with a single imaging modality. Biomedical applications are explored in the areas of functional neuro-imaging, fast tracking of agent kinetics and biodistribution, cardiovascular research, monitoring of therapies and drug efficacy as well as targeted molecular imaging studies. Handheld MSOT systems are further transforming optical imaging by offering new level of precision for clinical diagnostics of patients with e.g. breast and skin lesions, lymph node metastases, thyroid conditions and inflammatory bowel disease.

Biography: **Daniel Razansky** is Full Professor of Biomedical Imaging with appointments at the Faculty of Medicine, University of Zurich (UZH) and Department of Information Technologies and Electrical Engineering, ETH Zurich. SPECIAL EVENTS

11:20: Nanomaterials and light for sustainability and societal impact

Naomi Halas
Rice Univ. (USA)

Abstract: When excited by light, metallic nanoparticles undergo a coherent oscillation of their conduction electrons, known as a plasmon, responsible for their strong light-matter interactions. While the scientific foundation of this field has been built on noble and coinage metals, Aluminum, the most abundant metal on

our planet, can also support high-quality plasmonic properties spanning the UV-to-IR region of the spectrum. Coupling a plasmonic nanoantenna directly to catalytic nanoparticles transforms the complex into an efficient photocatalyst capable of driving chemical reactions under surprisingly mild, low-temperature conditions. This new type of light-based catalyst can be utilized for remediating greenhouse gases and converting them to useful molecules for industry, or benign molecules for a cleaner planet. We previously introduced photothermal effects for biomedical therapeutics; now, years after their initial demonstration, this approach is being utilized in human trials for the precise and highly localized ablation of cancerous regions of the prostate, eliminating the highly deleterious side-effects characteristic of conventional prostate cancer therapies. Photothermal effects can also be harvested for sustainability applications, like an off-grid solar thermal desalination system that transforms membrane distillation into a scalable water purification process.

Biography: **Naomi J. Halas** is the Stanley C. Moore Professor of Electrical and Computer Engineering at Rice University, where she also holds faculty appointments in the Departments of Physics and Astronomy, Chemistry, Materials Science and Nanoengineering, and Bioengineering. She is best known as the first person to demonstrate that controlling the geometry of metallic nanoparticles determines their color. She pursues studies of plasmonic and nanophotonic systems and their applications. She is author of more than 300 refereed publications, has more than 20 issued patents, and has presented more than 500 invited talks. She has been awarded the APS Frank Isakson Prize and Julius Lilienfeld Prize, the R. W. Wood Prize of the OSA, the ACS Award in Colloid Chemistry, and the Spiers Medal of the Royal Society of Chemistry. Halas has been elected to the National Academies of Sciences and Engineering (U. S.), and the American Academy of Arts and Sciences.
